Task 3 — Learn Terminal

Command - What It Does

pwd - Prints the full path of the current working directory — in other words, it tells you
exactly which folder the terminal is sitting in right now.

ls - Lists the files and folders contained in the current directory, giving a quick overview
of what's there.

ls -l - Lists the same contents as ls, but in a detailed "long" format that adds permissions,
number of links, owner, group, file size, and the date/time each item was last
modified.

ls -a - Lists all files and folders, including hidden ones. Hidden items are anything whose
name starts with a dot (.), which a plain ls does not show.

whoami - Prints the username of the account that is currently logged into the terminal session.

hostname - Prints the name assigned to the computer (the "host") being used, which is useful for
telling machines apart when working across more than one system.

date - Displays the current system date and time, including the day of the week, month,
day, time, and year.

cal - Displays a simple text calendar for the current month, with today's date typically
highlighted.
clear - Clears everything currently shown on the terminal screen, leaving a clean, empty
prompt. It does not delete any files or erase command history — it only changes
what is visible.

history - Displays a numbered list of commands that were typed earlier in the session, making
it easy to review or reuse past commands.
