# Task 4 — Create Meaningful Commits

DEVOPS-005: Git Advanced Workflow & Team Collaboration

## Why avoid vague commit messages?

Messages like "test", "update", "changes", or "final" don't explain what actually changed or why. Good commit messages follow a convention (e.g. Conventional Commits: type: short description) so the project history is readable, searchable, and useful when debugging or reviewing.

## Commit sequence used

### Commit 1

```
git add README.md
git commit -m "docs: add project README"
```

### Commit 2

```
git add .
git commit -m "chore: add project directory structure"
```

### Commit 3

```
git add DEVELOPMENT.md
git commit -m "docs: add development guidelines"
```

### Commit 4

```
git add script.py
git commit -m "feat: add initial script"
```

### Commit 5

```
git add tests/README.md
git commit -m "test: add test documentation"
```

### Commit 6

```
git add config.sample.yml
git commit -m "config: add sample configuration"
```

### Commit 7

```
git add README.md
git commit -m "docs: update project setup instructions"
```

## Resulting commit messages

```
docs: add project README
chore: add project structure
```

```
docs: add development guidelines
feat: add initial script
test: add test documentation
config: add sample configuration
docs: update project setup instructions
```

## Verify with

```
git log --oneline
```

This should show 7 commits, each with a clear, descriptive, type-prefixed message explaining exactly what was changed.
